

# THE BEST 25 MINUTE LESSON FOR MAKING CUSTOM APPS USING AI

---

Start building custom apps and understand AI (for real) in 25 minutes  
with Live app creation in Google Antigravity

# TODAY'S AGENDA

01 THE 3 LEVELS OF AI PRODUCTIVITY

02 CHATBOXES VS. PROJECT FOLDERS

03 THE IDEAL WAY TO USE AI TO WORK

04 APIS: THE COOK'S TICKET ANALOGY

05 LIVE BUILD: BUSINESS REVIEW PULLER

06 IDEAS FOR YOU TO BUILD AND GET SCALING

# WHAT ARE THE 3 LEVELS OF AI PRODUCTIVITY?

LEVEL 01 // THE CHATBOX

## WHAT IS AN AI CHATBOX?

---

Analytically, it is like a piece of paper passed back and forth between you and the AI. This is the experience of [chatgpt.com](https://chatgpt.com) or [claude.ai](https://claude.ai).

Powerful for conversation, quick questions, or research, but it remains very humanly involved. It cannot "do" anything or perform actions on its own.

# WHAT IS A PROJECT FOLDER?

---

Analogy: A plot of land on your computer to keep notes.

This is better than a chatbox for productivity. You can create documents to come back to later; plans, essays, scripts, roadmaps, and strategy.

Like a **file cabinet**: no work, no automation, just organization. It's a plot of land in your computer to keep notes around.

LEVEL 03 // PRODUCTION AI

# THE PRODUCTION SYSTEM

---

## ■ THE CONSTRUCTION CREW

Antigravity/Claude Code acts as your researcher, scripter, video editor, and publisher, building radio towers and factories on your digital plot of land.

## ■ THE RADIO TOWER (SERVERS)

Sends and receives signals from Google, Instagram, CRMs, and Calendars. It allows your app to communicate with the entire digital world.

## ■ THE FACTORY (AUTOMATION)

Runs on a schedule, generates content, sends messages, and pulls updates from websites routinely. It automates the repetitive work of your business.

ANALOGY // COMMUNICATION

# WHAT IS AN API?

## API = REQUEST

### THE WAITRESS (NORMAL WAY OF REQUESTING)

Human, visual, and natural language. She handles ambiguity and messy handwriting, cleaning up your order if something is unclear.

### THE COOK (API WAY OF REQUEST)

Giving the cook a ticket. A robotic form with strict checkboxes and abbreviations. Lightning fast but unforgiving.

- Cannot ask questions or clean up data
- Must be exact or the order fails
- Designed for machine-to-machine speed
- This is exactly how computer work in most things they do

# THE PROJECT

"We're going to build an app that pulls real reviews of local businesses"

## 01 OPEN GOOGLE ANTIGRAVITY

Getting comfortable with your construction crew

## 02 OPEN PROJECT FOLDER

Preparing your digital plot of land on your computer.

## 03 USE SERPAPI

Acquiring the official request form for Google reviews.

## 04 START BUILDING

Beginning the live website creation with AI guidance.

## 05 START FAILING

Embracing the break-and-fix loop of real development.

## 06 START PRODUCTIVITY

Deploying the tool to generate real business value.

FUTURE APPLICATIONS // SCALING

# SCALING YOUR SUCCESS

## ■ TRACK COMPETITOR REVIEWS AND PRICES

Automatically track competitor reviews and price changes across multiple platforms to identify market gaps and weaknesses in real-time.

## ■ AUTOMATE CONTENT

Build blog auto-generators or social media trackers that pull live data from APIs to create relevant, timely content for your audience.

## ■ RESEARCH AUTOMATION

Automate repetitive research tasks like pulling local event listings, real estate data, or industry-specific news directly into your project folder.

## ■ THE SUCCESS FORMULA

Every automation project follows the same core logic: connect an API, deploy an autonomous agent, and manage the output in a project folder.

API + ANTIGRAVITY + FOLDER = UNLIMITED POTENTIAL
